

# You plant in rows because its the most economical and efficient approach. Shouldn't you fertilize the same way?

## Broadcasting fertilizer is wasteful.

You wouldn't broadcast corn or bean seed—why would you broadcast your fertilizer? Broadcasting fertilizer is inefficient—you waste time, money, fuel and equipment upkeep putting down expensive nutrients to fertilize weeds and dirt, rather than placing it directly next to valuable crops. Make sense? Not at all. If you practice only precision planting and not precision fertilizing, you're only doing half the job.

## Missing out on higher yields

By not placing the fertilizer where it does the most good, you also may be missing out on significantly higher yields—up to 14 bushels per acre—according to a study done by the University of Illinois.

## Stricter EPA requirements.

The EPA has already begun requiring farmers to use methods that reduce the environmental impact of wasted nutrients

in water runoff. These mandates are bound to become stricter with time. By banding fertilizer instead of broadcasting, you'll reduce environmental impact and become a better steward of your land.

## Keep your fertilizer program on target with a Montag precision metering system.

With a Montag deep banding precision fertilizer system, you can place exactly how much fertilizer you need precisely where you need it. You'll achieve less waste and better yields at a lower cost while taking better care of your land and the environment around it. The Montag metering system is the right equipment for the job, and the fertilizer specialists at Polen Implement have the knowledge

and experience to steer you to the right Montag for your farm. For a free brochure, or to talk to a Polen Implement fertilizer specialist, call us at 1-866-541-2998 today!
